

Use of Excel for EDA

PivotTables

What are PivotTables

- A powerful tool for summarizing and presenting data.
- It does everything we've already learned, only it can be much faster and more efficient.
- They are very suitable for exploratory data analysis, as they allow us to aggregate and present data in very different and very fast ways.
- Can't be used for everything: some options and charts that can be used with Data Ranges or Tables can't be used with PivotTables.

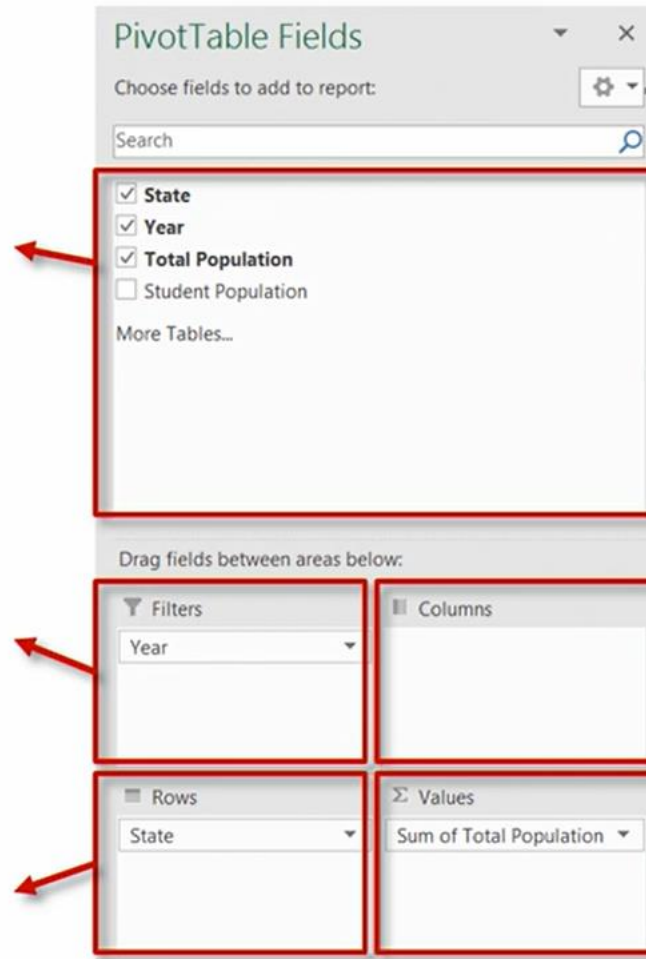

Create a PivotTable to analyze worksheet data

The **Field List** shows all the variables in your dataset, and which ones are currently included in the Pivot

If there are fields that you want to use to filter the whole data set, drag them to the **Filters** box

Variables included in the **Rows** field will appear as individual rows within the Pivot

Layout options allow you to adjust the look and feel of the field list

Variables included in the **Columns** field appear as individual *columns* within the Pivot

Numerical variables are almost always included in the **Values** field

(These are the quantitative measures that you care about: sales, revenue, clicks, etc.)

PivotTables

- We will focus on the following basic features of PivotTables:
 - [Create a PivotTable to analyze worksheet data](#)
 - [Use the Field List to arrange fields in a PivotTable](#)
 - [Filter data in a PivotTable](#)
 - [Create a PivotChart](#)
